

Package: disclapmix (via r-universe)

October 1, 2024

Type Package

Title Discrete Laplace Mixture Inference using the EM Algorithm

Version 1.7.4.9910

Author Mikkel Meyer Andersen [aut, cre], Poul Svante Eriksen [aut]

Maintainer Mikkel Meyer Andersen <mikl@math.aau.dk>

Description Make inference in a mixture of discrete Laplace distributions using the EM algorithm. This can e.g. be used for modelling the distribution of Y chromosomal haplotypes as described in [1, 2] (refer to the URL section).

disclapmix-package *disclapmix*

Description

Discrete Laplace Mixture Inference using the EM Algorithm. A central function is [disclapmix_adaptive](#) (and the underlying [disclapmixfit](#)).

Author(s)

Mikkel Meyer Andersen <mikl@math.aau.dk> and Poul Svante Eriksen <svante@math.aau.dk>

clusterdist	<i>Calculate distance between clusters</i>
-------------	--

Description

clusterdist calculates the distance between each pair of clusters. The distance measure is based on a symmetric Kullback-Leibler divergence.

Usage

```
clusterdist(fit, ...)
```

Arguments

fit	A disclapmixfit object.
...	Not used

Value

A distance matrix

See Also

[disclapmix-package](#) [disclapmix](#) [disclapmixfit](#) [clusterprob](#) [predict.disclapmixfit](#) [print.disclapmixfit](#) [summary.disclapmixfit](#) [simulate.disclapmixfit](#) [disclap](#)

clusterprob	<i>Cluster origin probabilities for haplotypes</i>
-------------	--

Description

clusterprob calculates the cluster origin probabilities for haplotypes.

Usage

```
clusterprob(fit, newdata, ...)
```

Arguments

fit	A disclapmixfit object.
newdata	The haplotypes to predict the cluster origin probabilities for.
...	Not used

Value

A matrix where the rows correspond to the rows in newdata and the sum of each row is 1.

See Also

[disclapmix-package](#) [disclapmix](#) [disclapmixfit](#) [clusterdist](#) [predict.disclapmixfit](#) [print.disclapmixfit](#) [summary.disclapmixfit](#) [simulate.disclapmixfit](#) [disclap](#)

`contributor_pairs` *Contributor pairs from a 2 person mixture*

Description

Get all possible contributor pairs from a 2 person mixture

Usage

```
contributor_pairs(mixture)
```

Arguments

`mixture` A list of integer vectors. The *k*'th element in the list is an integer vector with the alleles in the mixture at locus *k*.

Value

A `contrib_pairs` object that is a unordered list of pairs. Note, that contributor order is disregarded so that each contributor pair is only present once (and not twice as would be the case if taking order into consideration). See example usage at [rank_contributor_pairs](#).

See Also

`danesh` *Y-STR haplotypes*

Description

185 Y-STR 10 loci haplotypes

Format

A data frame with 185 observations on the following 10 loci (n is the number of times each haplotype has been observed)

DYS19
DYS389I
DYS389II
DYS390
DYS391

disclapmix

Discrete Laplace mixture inference using the EM algorithm

Description

disclapmix makes inference in a mixture of Discrete Laplace distributions using the EM algorithm. After the EM algorithm has converged, the centers are moved if the marginal likelihood increases by doing so. And then the EM algorithm is run again. This continues until the centers are not moved.

Usage

```
disclapmix(  
  x,  
  clusters,  
  init_y = NULL,  
  iterations = 100L,  
  eps = 0.001,  
  verbose = 0L,  
  glm_method = "internal_coef",  
  glm_control_maxit = 50L,  
  glm_control_eps = 1e-06,  
  init_y_method = "pam",  
  init_v = NULL,  
  ret_x = FALSE,  
  ...  
)
```

Arguments

<code>x</code>	Dataset.
<code>clusters</code>	The number of clusters/components to fit the model for.
<code>init_y</code>	Initial central haplotypes, if NULL, these will be estimated as described under the <code>init_y_method</code> argument.
<code>iterations</code>	Maximum number of iterations in the EM-algorithm.
<code>eps</code>	Convergence stop criteria in the EM algorithm which is compared to $\frac{\max\{v_{new} - v_{old}\}}{\max\{v_{old}\}}$, where v is a matrix of each observation's probability of belonging to a certain center.
<code>verbose</code>	from 0 to 2 (both including): 0 for silent, 2 for extra verbose.
<code>glm_method</code>	<code>internal_coef</code> , <code>internal_dev</code> or <code>glm.fit</code> . Please see details.
<code>glm_control_maxit</code>	Integer giving the maximal number of IWLS iterations.
<code>glm_control_eps</code>	Positive convergence tolerance epsilon; the iterations converge when $ x - x_{old} / (x + 0.1) < \text{epsilon}$, where $x = \text{beta_correction}$ for <code>internal_coef</code> and $x = \text{deviance}$ otherwise.
<code>init_y_method</code>	Which cluster method to use for finding initial central haplotypes, <code>y</code> : <code>pam</code> (recommended), <code>clara</code> or <code>hclust</code> . Ignored if <code>init_y</code> is supplied.
<code>init_v</code>	Matrix with <code>nrow(x)</code> rows and <code>clusters</code> columns specifying initial posterior probabilities to get EM started, if none specified, then <code>matrix(1/clusters, nrow = nrow(x), ncol = clusters)</code> is used.
<code>ret_x</code>	Return data <code>'x'</code>
<code>...</code>	Used to detect obsolete usage (when using parameters <code>centers</code> , <code>use.parallel</code> , <code>calculate.logLs</code> or <code>plots.prefix</code>).

Details

`glm_method`: `internal_coef` is the fastest as it uses the relative changes in the coefficients as a stopping criterium, hence it does not need to compute the deviance until the very end. In normal situations, it would not be a problem to use this method. `internal_dev` is the reasonably fast method that uses the deviance as a stopping criterium (like `glm.fit`). `glm.fit` to use the traditional `glm.fit` IWLS implementation and is slow compared to the other two methods.

`init_y_method`: For `init_y_method = 'clara'`, the sampling parameters are: `samples = 100`, `sampsize = min(ceiling(nrow(x)/2), 100 + 2*clusters)` and the random number generator in R is used.

Value

A `disclapmixfit` object:

list("glm_method") The supplied GLM method.

list("init_y") The supplied initial central haplotypes, `init_y`.

list("init_y_method") The supplied method for choosing initial central haplotypes (only used if `init_y` is NULL).

- list("converged")** Whether the estimation converged or not.
- list("x")** Dataset used to fit the model if 'ret_x' is 'TRUE', else 'NULL'.
- list("y")** The central haplotypes, y.
- list("tau")** The prior probabilities of belonging to a cluster, tau.
- list("v_matrix")** The matrix v of each observation's probability of belonging to a certain cluster. The rows are in the same order as the observations in x used to generate this fit.
- list("disclap_parameters")** A matrix with the estimated discrete Laplace parameters.
- list("glm_coef")** The coefficients from the last GLM fit (used to calculate disclap_parameters).
- list("model_observations")** Number of observations.
- list("model_parameters")** Number of parameters in the model.
- list("iterations")** Number of iterations performed in total (including moving centers and re-estimating using the EM algorithm).
- list("logL_full")** Full log likelihood of the final model.
- list("logL_marginal")** Marginal log likelihood of the final model.
- list("BIC_full")** BIC based on the full log likelihood of the final model.
- list("BIC_marginal")** BIC based on the marginal log likelihood of the final model.
- list("v_gain_iterations")** The gain $\frac{\max\{v_{new}-v_{old}\}}{\max\{v_{old}\}}$, where v is vic_matrix mentioned above, during the iterations.
- list("tau_iterations")** The prior probability of belonging to the centers during the iterations.
- list("logL_full_iterations")** Full log likelihood of the models during the iterations (only calculated when verbose = 2L).
- list("logL_marginal_iterations")** Marginal log likelihood of the models during the iterations (only calculated when verbose = 2L).
- list("BIC_full_iterations")** BIC based on full log likelihood of the models during the iterations (only calculated when verbose = 2L).
- list("BIC_marginal_iterations")** BIC based on marginal log likelihood of the models during the iterations (only calculated when verbose = 2L).

Examples

```
# Generate sample database
db <- matrix(disclap::rdisclap(1000, 0.3), nrow = 250, ncol = 4)

# Add location parameters
db <- sapply(1:ncol(db), function(i) as.integer(db[, i]+13+i))

head(db)
```

```

fit1 <- disclapmix(db, clusters = 1L, verbose = 1L, glm_method = "glm.fit")
fit1$disclap_parameters
fit1$y

fit1b <- disclapmix(db, clusters = 1L, verbose = 1L, glm_method = "internal_coef")
fit1b$disclap_parameters
fit1b$y

max(abs(fit1$disclap_parameters - fit1b$disclap_parameters))

# Generate another type of database
db2 <- matrix(disclap::rdiscap(2000, 0.1), nrow = 500, ncol = 4)
db2 <- sapply(1:ncol(db2), function(i) as.integer(db2[, i]+14+i))
fit2 <- disclapmix(rbind(db, db2), clusters = 2L, verbose = 1L)
fit2$disclap_parameters
fit2$y
fit2$tau

```

disclapmix_adaptive *Adaptive fitting*

Description

A wrapper around ‘disclapmix_robust()’ that instead of fitting one model for a given number of clusters, fits models until the best model (lowest marginal BIC) is in the interior (with margin ‘M’) of all number of clusters tried.

Usage

```

disclapmix_adaptive(
  x,
  label = "DL",
  margin = 5L,
  criteria = "BIC",
  init_y_generator = NULL,
  init_v_generator = NULL,
  ...
)

```

Arguments

x	Dataset.
margin	Fit models until there is at least this margin
criteria	The slot to chose the best model from (BIC/AIC/AICc)
init_y_generator	Function taking the number of clusters as input and returns ‘init_y’ values

```

init_v_generator      Function taking the number of clusters as input and returns 'init_v' values
...                  Passed on to 'disclapmix_robust()' (and further to 'disclapmix()')
```

Details

E.g., the best model has 3 clusters and the margin 'M = 5', then this function ensures that models with 1, 2, ..., 3+5 = 8 clusters are fitted. If e.g. then 7 is better than 3, then it continues such that also models with up to 7+5 = 12 clusters are fitted.

Note that models with 1-5 clusters are always fitted.

Value

A list of all 'disclapmix' fits

Examples

```

data(danes)
db <- as.matrix(danes[rep(1:nrow(danes), danes$n), 1:(ncol(danes)-1)])
fits <- disclapmix_adaptive(db, margin = 5L)
fits
BICs <- sapply(fits, function(x) x$BIC_marginal)
BICs
ks <- sapply(fits, function(x) nrow(x$y)) # Always same as seq_along(fits)
ks
max_k <- max(ks)
best_k <- which.min(BICs)
max_k
best_k
max_k - best_k # = margin = 5
plot(ks, BICs, type = "b")

fits_clara <- disclapmix_adaptive(db, margin = 5L, init_y_method = "clara")
```

disclapmix_robust *Robust fitting*

Description

A wrapper around 'disclapmix()' that tries to avoid errors. Can sometimes avoid errors with SVD problems happening with 'glm_method = 'internal_coef'' and 'glm_method = 'internal_dev''. This is done by taking a random subset of observations.

Usage

```
disclapmix_robust(
  x,
  clusters,
  rnd_obs = min(5L * clusters, round(nrow(x)/2)),
  rnd_tries = 10,
  ...
)
```

Arguments

x	Dataset.
clusters	The number of clusters/components to fit the model for.
rnd_obs	Number of random observations in subset if initial fit fails
rnd_tries	Number of tries with random subset if initial fit fails
...	Passed on to 'disclapmix()'

Examples

```
data(danes)
db <- as.matrix(danes[rep(1:nrow(danes), danes$n), 1:(ncol(danes)-1)])
fit <- disclapmix_robust(db, 3L)
fit
```

generate_mixture *Generate a mixture*

Description

This function can generate a mixture given a list of contributors.

Usage

```
generate_mixture(profiles)
```

Arguments

profiles	A list with profiles to mix.
----------	------------------------------

Value

A list, e.g. for use with [contributor_pairs](#). See example usage at [rank_contributor_pairs](#).

See Also

[contributor_pairs](#) [rank_contributor_pairs](#) [disclapmix-package](#) [disclapmix](#) [disclapmixfit](#)

[disclap](#)

get_rank	<i>Get rank of pair</i>
----------	-------------------------

Description

Get rank of pair

Usage

```
get_rank(x, haplotype)
```

Arguments

x	A ranked_contrib_pairs object.
haplotype	A haplotype.

haplotype_diversity	<i>Calculate haplotype diversity from a disclapmixfit</i>
---------------------	---

Description

Calculate haplotype diversity from a [disclapmixfit](#) object. The method is based on simulating a huge database that approximates the population.

Usage

```
haplotype_diversity(object, nsim = 10000L)
```

Arguments

object	a disclapmixfit object, usually from a result of a call to disclapmix .
nsim	number of haplotypes to generate for calculating the haplotype diversity.

Value

The calculated haplotype diversity.

See Also

[disclapmix](#) [disclapmixfit](#) [predict.disclapmixfit](#) [print.disclapmixfit](#) [summary.disclapmixfit](#)
[simulate.disclapmixfit](#)

plot.disclapmixfit *Plot a disclapmixfit*

Description

Plot a `disclapmixfit` object.

Usage

```
## S3 method for class 'disclapmixfit'  
plot(x, which = 1L, clusdist = clusterdist(x), ...)
```

Arguments

<code>x</code>	a <code>disclapmixfit</code> object, usually from a result of a call to <code>disclapmix</code> .
<code>which</code>	What plot to make. <code>1L</code> = clusters and their distances.
<code>clusdist</code>	To use previously computed cluster distances to avoid doing the same computations twice.
<code>...</code>	not used

Value

A data frame with discrete Laplace distributions for each cluster and locus. Side effect: A plot.

See Also

`disclapmix` `disclapmixfit` `predict.disclapmixfit` `print.disclapmixfit` `simulate.disclapmixfit`
`summary.disclapmixfit`

Examples

```
data(danes)  
db <- as.matrix(danes[rep(1:nrow(danes), danes$n), 1:(ncol(danes)-1)])  
fit <- disclapmix(db, clusters = 4L)  
plot(fit)
```

```
plot.ranked_contrib_pairs
      Plot ranked contributor pairs
```

Description

Plot ranked contributor pairs

Usage

```
## S3 method for class 'ranked_contrib_pairs'
plot(x, top = NULL, ..., xlab = "Rank", ylab = "P(H1)P(H2)")
```

Arguments

x	A ranked_contrib_pairs object.
top	The top ranked number of pairs to print. NULL for all.
...	Delegated to the generic plot function.
xlab	Graphical parameter.
ylab	Graphical parameter.

```
predict.disclapmixfit Predict from a disclapmixfit
```

Description

Is able to predict haplotype frequencies using a [disclapmixfit](#) object.

Usage

```
## S3 method for class 'disclapmixfit'
predict(object, newdata, marginalise = FALSE, ...)
```

Arguments

object	a disclapmixfit object
newdata	the haplotypes in matrix format to estimate haplotype probabilities for
marginalise	Should loci with 'NA' be dealt with by marginalising out that locus?
...	not used

Details

Note that 'NA' values give rise to an error unless the 'marginalise' argument is set to 'TRUE'.

`print.contrib_pairs` *Print contributor pairs*

Description

Print contributor pairs

Usage

```
## S3 method for class 'contrib_pairs'
print(x, ...)
```

Arguments

<code>x</code>	A <code>contrib_pairs</code> object.
<code>...</code>	Ignored

`print.disclapmixfit` *Print a disclapmixfit*

Description

Prints a [disclapmixfit](#) object.

Usage

```
## S3 method for class 'disclapmixfit'
print(x, ...)
```

Arguments

<code>x</code>	a disclapmixfit object, usually from a result of a call to <code>disclapmix</code> .
<code>...</code>	not used

```
print.ranked_contrib_pairs
    Print ranked contributor pairs
```

Description

Print ranked contributor pairs

Usage

```
## S3 method for class 'ranked_contrib_pairs'
print(x, top = 5L, hide_non_varying_loci = TRUE, ...)
```

Arguments

x	A ranked_contrib_pairs object.
top	The top ranked number of pairs to print/plot. NULL for all.
hide_non_varying_loci	Whether to hide alleles on loci that do not vary.
...	Ignored

```
rank_contributor_pairs
    Separate a 2 person mixture
```

Description

Separate a 2 person mixture by ranking the possible contributor pairs.

Usage

```
rank_contributor_pairs(contrib_pairs, fit, max_rank = NULL)
```

Arguments

contrib_pairs	A contrib_pairs object obtained from contributor_pairs .
fit	A disclapmixfit object.
max_rank	Not used. Reserved for future use.

Value

A ranked_contrib_pairs object that is basically an order vector and the probabilities for each pair (in the same order as given in contrib_pairs), found by using fit. Note, that contributor order is disregarded so that each contributor pair is only present once (and not twice as would be the case if taking order into consideration).

best_fit_BIC <- fits[[which.min(sapply(fits, function(fit) fit$BIC_marginal))]]
best_fit_BIC

ranked_contributors_BIC <- rank_contributor_pairs(possible_contributors, best_fit_BIC)
ranked_contributors_BIC

plot(ranked_contributors_BIC, top = 10L, type = "b")

get_rank(ranked_contributors_BIC, h1)
```

```
simulate.disclapmixfit
```

Simulate from a disclapmixfit

Description

Simulate from a [disclapmixfit](#) object.

Usage

```
## S3 method for class 'disclapmixfit'  
simulate(object, nsim = 1L, seed = NULL, cluster = NULL, ...)
```

Arguments

object	a disclapmixfit object, usually from a result of a call to <code>disclapmix</code> .
nsim	number of haplotypes to generate.
seed	not used
cluster	which cluster to simulate from (if 'NULL', the default, take a random according to the a priori probabilities)
...	not used

Value

A matrix where the rows correspond to the simulated haplotypes.
